

1. Compare **Test Plan** with **Test Case**.

Aspect	Test Plan	Test Case
Definition	A detailed document that outlines the scope, approach, resources, and schedule of testing activities.	A specific set of conditions or steps used to verify a particular feature or functionality.
Purpose	To guide the overall testing strategy and process.	To validate whether the software behaves as expected for a specific scenario.
Contents	Objectives, test scope, test items, schedule, resources, roles, risk analysis, and tools.	Test ID, test steps, expected results, actual results, preconditions, and status.
Level	High-level document that covers the entire testing process.	Low-level document focusing on individual functionalities or modules.
Prepared by	Usually created by the Test Manager or QA Lead.	Usually created by Testers or QA Engineers.
Time of Creation	Created during the test planning phase.	Created after the test plan is ready, during test design or execution phase.

2. What are the characteristics of good test cases?

- **Accurate:** Exacts the purpose.
- **Economical:** No unnecessary steps or words.
- **Traceable:** Capable of being traced to requirements.
- **Repeatable:** Can be used to perform the test over and over.
- **Reusable:** Can be reused if necessary.

3. Compare **Positive Test Case** with **Negative Test Case**.

Aspect	Positive Test Case	Negative Test Case
Purpose	To verify that the system behaves as expected with valid input or actions.	To verify that the system can gracefully handle invalid input or unexpected actions.
Input Type	Valid data that meets the requirements and expected conditions.	Invalid, incorrect, or unexpected data to test error handling.
Expected Outcome	Successful completion of the operation or expected output.	System should throw appropriate errors or reject the input without crashing.
Example	Logging in with a correct username and password.	Logging in with a blank password or invalid username.
Goal	To confirm the system does what it's supposed to do.	To ensure the system doesn't do what it's not supposed to do.
Importance	Confirms core functionality works under normal conditions.	Validates system robustness and error-handling capability.

4. Discuss the purpose of **Test Monitoring**.

Test Monitoring : Track the testing works as we carry out.

Purpose:

- **Give feedback** to the test team and manager on the on-going test, to allow the opportunity **to guide and improve the testing**.
- Provide the project team with **visibility of the test results**.
- **Measure the status** of testing, test coverage and test items **against test exit criteria** to determine whether the test is done.
- Gather data for use in **estimating future test efforts**.

5. When to start writing test cases?

- Test cases must exercise EVERY FEATURE of the application to prevent defects from being released.
- Each test case needs to contain a set of test steps of a feature or function.
- At the end of the test the expected results are compared to actual results to determine if the application is working as it should.

6. What are the items found in a test case?
 - System specifications
 - User documentation.
 - Function and flow of the application
7. Discuss the effects of incomplete or incorrect information of a test case.
 - Wrong objective of test
 - Target wrong test object
 - Incorrect way of performing test
 - Not traceable

And many more.....

8. Discuss the purpose of test readiness review.

To provide management with the assurance that the software has undergone a thorough test process and is ready for turnover to the next test phase.
9. Compare the three levels of test readiness review at application (software company) level.
 - Development Test Readiness Review
 - **Informal** test readiness review conducted following successful **completion of unit / module testing** of a given application.
 - Project Test Readiness Review
 - **Formal** test readiness review conducted following successful **completion of the Software Integration Test (SIT)** of a given application.
 - Enterprise Test Readiness Review
 - **Formal** test readiness review conducted following successful **completion of the Functional Validation Test (FVT)** of a given application.

10. Compare the two levels of test readiness review at enterprise (client) level.
- Acceptance Test Readiness Review
 - **Formal** test readiness review conducted following successful **completion of the Enterprise Integration Test and Performance Test** of each release.
 - Implementation Test Readiness Review
 - **Formal** readiness review conducted following successful **completion of the Enterprise Acceptance Test** and portions, if not all of the Operational Assessment at the Enterprise level for a given release.
